1

Virtual Reality

Virtual reality (VR) is a simulation in which computer graphics is used to create a **realistic-looking world**. Moreover, the synthetic world **responds to the user's input** (gesture, verbal commands, etc.)

Real-time Interactivity

“Real-time” means that the computer is able to detect a **user's input** and **modify the virtual world instantaneously**. People like to see things change on the screen in response to their commands and become captivated by the simulation.

March 2019

AAV1819- VirtualReality- Part I

2

Virtual Reality

Interactivity and its captivating power contributes to the feeling of **immersion**, of **being part of the action on the screen**, that the user experiences.

But virtual reality pushes this even further by potentially using **all human sensorial channels**.

In some VR systems, users not only see and manipulate graphic objects on the screen, they also **touch** and **feel** them.

March 2019

AAV1819- VirtualReality- Part I

4

Virtual Reality

Definition

Virtual reality is a high-end user-computer interface that involves **real-time simulation** and **interactions** through **multiple sensorial channels**. These sensorial modalities are visual, auditory, tactile, smell and taste.

Output:
Sensory feedback

Olfactive display (smell) has been experimented with sparingly, and computer-controlled display of gustation (taste) are at the stage of early research.

March 2019

5

Virtual Reality -The three I's of virtual reality

VR is both **interactive** and **immersive**.

VR is not just a medium or a high-end user interface, it also has applications that involve **solutions to real problems** in **engineering, medicine, the military**, etc. The extent to which an application is able to solve a particular problem, that is, the extent to which a simulation performs well, depends very much on the human **imagination**.

Interaction + Immersion + Imagination

March 2019

AAV1819- VirtualReality- Part I

7

Virtual Reality

Virtual reality is a medium that allows us to have a simulated experience **approaching that of physical reality**.

Virtual reality also allows us to **reduce the danger of physical reality** and to create scenarios not possible in the real world.

8

Virtual Reality

The **Sense of Presence** (SoP) is the subjective **sensation** of “**being in the Virtual Environment**”. It is a complex mental mechanism that is strongly linked to our emotional reasoning abilities, **depending on the user’s abstraction capacities**.

The concept of presence is not restricted to VR: reading a book, watching TV, and talking on the phone can all engender some level of presence. This is why there is currently no single agreed upon way to appreciate its quality.

12

Virtual Reality

When experiencing a space with other human participants, it is often important to be able to **sense their presence in the world** where they are located, which way they are looking/pointing, and what they are saying.

The Hindi word *avatar* (which means the worldly incarnation of a deity) is used to denote the concept of **representing users in a virtual world**.

Avatar:

1. a virtual object used to represent a participant or physical object in a virtual world; the (typically visual) representation may take any form.
2. The object embodied by a participant.

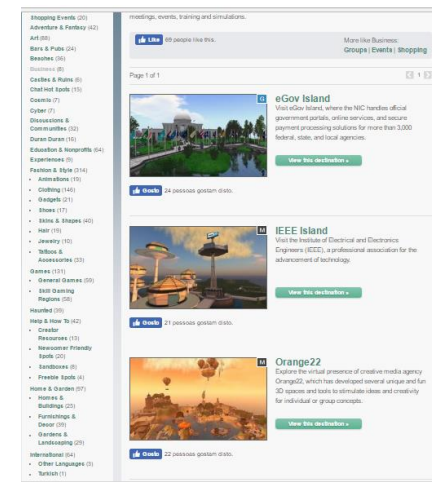

(ex: Second-life, see next slides)

16

A little bit of history...

March 2019

AAV1819- VirtualReality- Part I

15

This VR workstation had 3-D video feedback, motion, color, stereo sound, aromas, wind effects (using small fans placed near the user's head) and a seat that vibrated.

But a major component was missing:

System response based on user's actions.

March 2019

AAV1819- VirtualReality- Part I

18

Virtual Reality- First AR system

The work of Morton Heiling on head-mounted displays was continued by **Ivan Sutherland**, 1966. This author realized that he could use **computer-generated scenes instead of analog images** taken by cameras.

Typical VR System

March 2019

AAV1819- VirtualReality- Part I

22

VR –Output Devices

Output devices: designed to provide feedback from the simulation in response to this input. The **sensorial channels fed back by these interfaces are:**

- **sight** (through **graphic displays**),
- **sound** (through **3D sound displays**)
- **touch** (through **haptic* displays**)
- **taste** and **smell** (...)

(* The Greek word *haptai* means touch)

25

VR –Output Devices- graphics display

A **graphics display** is a computer interface that presents synthetic world images **to one** or **several users** interacting with the virtual world.

personal graphics display

large volume displays

March 2019

AAV1819- VirtualReality- Part I

24

VR –Output Devices- graphics display

Wide field of view (FOV) is an important characteristic for **immersive environments**.

A typical human has a total horizontal field of view between 160 and 208 degrees and a binocular field of view (important for **depth perception**) between 120 and 180 degrees.

Since the FOV is so wide, **it is impossible to completely fill the users vision with a single flat screen.**

March 2019

AAV1819- VirtualReality- Part I

26

VR –Output Devices- **graphics displays**

Spatial multiplexing (3D) consists of positioning separate images in front of each eye:

- using two small separate screens ← Ex: HMD
- using a filter to separate the views ← Ex: anaglyphic glasses

Sistema Infitec passivo

“ Para obter a visualização estéreo, característica fundamental para a sensação de imersão no ambiente virtual, é utilizado o **sistema Infitec passivo** [INFITEC], isto é: **as cores do espectro visível são divididas em seis intervalos, dois para cada cor primária, e a cada olho é associado um intervalo de cada uma das cores.** São adicionados aos projectores e às lentes dos óculos dos utilizadores **filtros** de passa banda específicos para separar as imagens a serem percebidas por cada olho. Os dois projectores transmitem concorrentemente as imagens filtradas do olho direito e esquerdo”

CAVE Holospace do Centro de Ciência Viva do Lousal

39

VR –Output Devices- graphics displays

Polarized glasses

VR glasses

To present a stereoscopic motion picture, **two images are projected superimposed onto the same screen through orthogonal polarizing filters.**

The viewer wears low-cost eyeglasses which also contain a pair of orthogonal **polarizing filters.**

As **each filter only passes light which is similarly polarized** and blocks the orthogonally polarized light, each eye only sees one of the images, and the effect is achieved.

Each eye sees only the information intended for it.

March 2019

37

VR –Output Devices- graphics displays

If the virtual scene is destined to be viewed by a **single user** it is called a **personal graphics display.**

- Head-mounted displays (HMDs)
- Desk supported displays

March 2019

AAV1819- VirtualReality- Part I

41

Head-mounted displays (HMD)

What happens when the user moves his head?

March 2019

AAV1819- VirtualReality- Part I

42

Positional tracking

Positional tracking detects the precise position of the **head-mounted displays**, controllers, other objects or body parts within **Euclidean space**. Positional tracking registers the exact position due to recognition of the rotation (**pitch, yaw and roll**) and recording of the translational movements.

https://en.wikipedia.org/wiki/Positional_tracking

March 2019

AAV1819- VirtualReality- Part I

43

Cybersickness

In a **VR system** if the time delay between corresponding head and image motions is too large, simulation sickness may occur (it may be called **cybersickness**).

To alleviate this problem, it is necessary to have **almost instantaneous response to the user's head motion**.
